

Progress Report
October 31, 2019
Group Name: kawai_adrien

First of all, we are not yet committing to our Git repository since we do not want to push code that will not be used. We are still in the Java refresher stage. Although we have some code that we were able to create public washroom locations objects from our input data. Our next step will be to integrate those objects to display pins in Google Maps for the location of the washrooms.

We are having some issues regarding our Google Maps API key. From our current research, it seems like Google is requiring our payment information in order to access certain API calls. We are trying to find a workaround to avoid entering our payment information. However, this should not hold us back too long from making progress because we are knowledgeable with Google Maps API since we have experience from prior classes.

Overall, since the midterms are over, we should be able to ramp up our progress in this iteration of the project. We will try to dedicate more time to this project and hopefully deliver a working application.
